# Preface

## D-I-R Annual 2017 – The German IVF-Registry

V. Blumenauer, U. Czeromin, D. Fehr, K. Fiedler, C. Gnoth, J.-S. Krüssel, M.S. Kupka, A. Ott, A. Tandler-Schneider

Once again it is our great pleasure to present the 2017 annual report of the data collected by the German IVF-Registry (D-I-R). The Registry looks back onto more than 30 years of diligent data collection, extraction, and evaluation.

Since 1996, the German IVF-Registry has been electronically collecting data for each initiated treatment cycle. Meanwhile, nearly 1.8 million ART cycles (ART: Assisted Reproduction Technology) since 1982 and nearly 300,000 children born since 1997 have been documented in the database. The prospective documentation as well as the cycle-by-cycle data collection are of particular value and make the German IVF-Registry unique world-wide.

This Yearbook 2017 is like the Yearbook 2016 a yearbook of change and of organizational efforts undertaken by all authors and contributors. After years of data control and reconciliation, administrative work and programming, the implementation of a new data system has been rolled out to the IVF-clinics.

This is still a major change and required huge modifications within the existing, heterogeneous IT environments of those pioneering centers. We want to express our thanks to everyone contributing to this process: the software companies, the D-I-R data management group, the D-I-R office, and particularly the associates within those centers.

The 2017 yearbook is based on exploitable exports from 134 centers, for which a number of 105,049 plausible cycles was

documented. A total of 68,605 women were treated in 2017, resulting in a mean of 1.6 cycles per woman. We are happy to note that the pregnancy rate per transfer in fresh cycles was at 31.4%, whereas the pregnancy rate per transfer in cryo cycles was 26.2%. In the previous year, 2016, the documented birth rate per embryo transfer was 22.5% in fresh cycles and 17.7% in cryo cycles, with a still very good general pregnancy outcome documentation of 89%.

Remarkably, 67.3% of the pregnancies led to a birth. A birth rate of 22.5% per embryo transfer was achieved. For comparison, the probability for a 25 year old woman to become pregnant WITHOUT any medical assistance averages at 23%. For a 35 year old woman this probability decreases to 16%, according to the [Bundesgesundheitsblatt 2013; 56: 1633–41].

This year, again, particular attention was placed on the known problems of multiple pregnancies within ART cycles. In 2016, the rate of twin births was 21.1% in fresh cycles and 15.2% in cryo cycles. As this rate is still too high, we dedicated the editorial 2017 again to the motto „LESS is MORE“.

The data presented in this yearbook demonstrate the high quality of reproductive medicine in Germany, leading to impressive results even under the restrictive legislation: in accordance with the “Embryo Protection Act” of 1990, the elective single embryo transfer (eSET) is still unlawful in Germany. Egg donation is forbidden as well. Cryopreservation is allowed for usually 2-PN stage

oocytes only. The regulation that only a maximum of three embryos may be transferred has certainly led to positive effects. Due to the increasing quality of stimulation, improved oocyte treatment, and changes in transfer technology, the average number of transferred embryos has decreased by more than 25% in fresh cycles since 1997. By transferring no more than an average of 1.80 embryos after IVF and 1.83 after ICSI, the doctors for reproductive medicine in Germany have continued to adhere to their responsible approach towards the reduction of multiples.

Good and diligent documentation is proof of a highly organized and efficient workflow. The prospective cycle-by-cycle data collection is another quality feature of the German IVF-Registry, a feature that sets the German IVF-Registry apart from any other registry in the world. The results of the comprehensive data collection in the German IVF-Registry and its reports have been cited in numerous scientific publications, nationally as well as internationally, lending support and impetus to scientific research.

Furthermore, the data have contributed to the continuous improvement of quality within the German centers for reproductive medicine. Physicians, biologists, and patients alike have benefited from the tedious work necessary to collect, export, and evaluate as well as publish the data. Therefore, we express our gratitude to all those involved.

Thank you and keep up the good work!

Registry Participants	5	28	53		112	116	120		124	128	130	128	134	

\*) One center has still been without interface, six centers did not export with regard to due day, one center did not export for unknown reasons.  
10 centers exported via the old interface, 124 centers exported via the new interface ARTbox®.

\*\*) Base quantity: Total number of women, including implausible treatment cycles  
(\*\*\*) Since the last annual, three new members have joined the Deutsches IVF-Register.

From 1999 on each initiated cycle is documented.

1) No treatment: treatments aborted prior to oocyte culture respectively before cryo-thawing.

2) "Total" may contain GIFT cases. Documentation has been neglected since 2005 due to lack of statistical relevance

# Number of Ovum Pick-Up Cycles (OPU) 1982–2017

IVF, ICSI\* – Prospective and Retrospective Data

\*) OPUs leading to an IVF- and/or ICSI oocyte treatment

Where IVF/ICSI is not explicitly mentioned, the treatments were added to ICSI.

1) In 345 cases no IVF- or ICSI treatment was performed. 102 are cases in which oocytes were recovered but nevertheless a cryo transfer was performed

2) Reason: e.g. immature oocytes or no sperm available

3) Mean
